

Plugging a tire:

Step 1: Remove foreign object and be ready for step 2 & step 3 as the air will escape rapidly.

Step 2: Add lubricant to the reamer tool (spiral shaft).

Step 3: Insert the reamer tool and clean the hole by twisting, turning while pulling in and out, spend a minute doing that as it will help step 5.

Step 4: Push/tread the plugging cord through the eye of the insertion tool until even overhang is achieved. Add some lubricant to the tip of the insertion tool (the tip only).

Step 5: Use you weight and strength to push the insertion tool into the hole until the plug has only 10/15mm sticking out. Do not twist or turn while pushing the plugging cord in and don't push the entire cord in.

Step 6: Pull the insertion tool out and cut off the remaining cord sticking out. Reinflate the tire and check for leaks.
